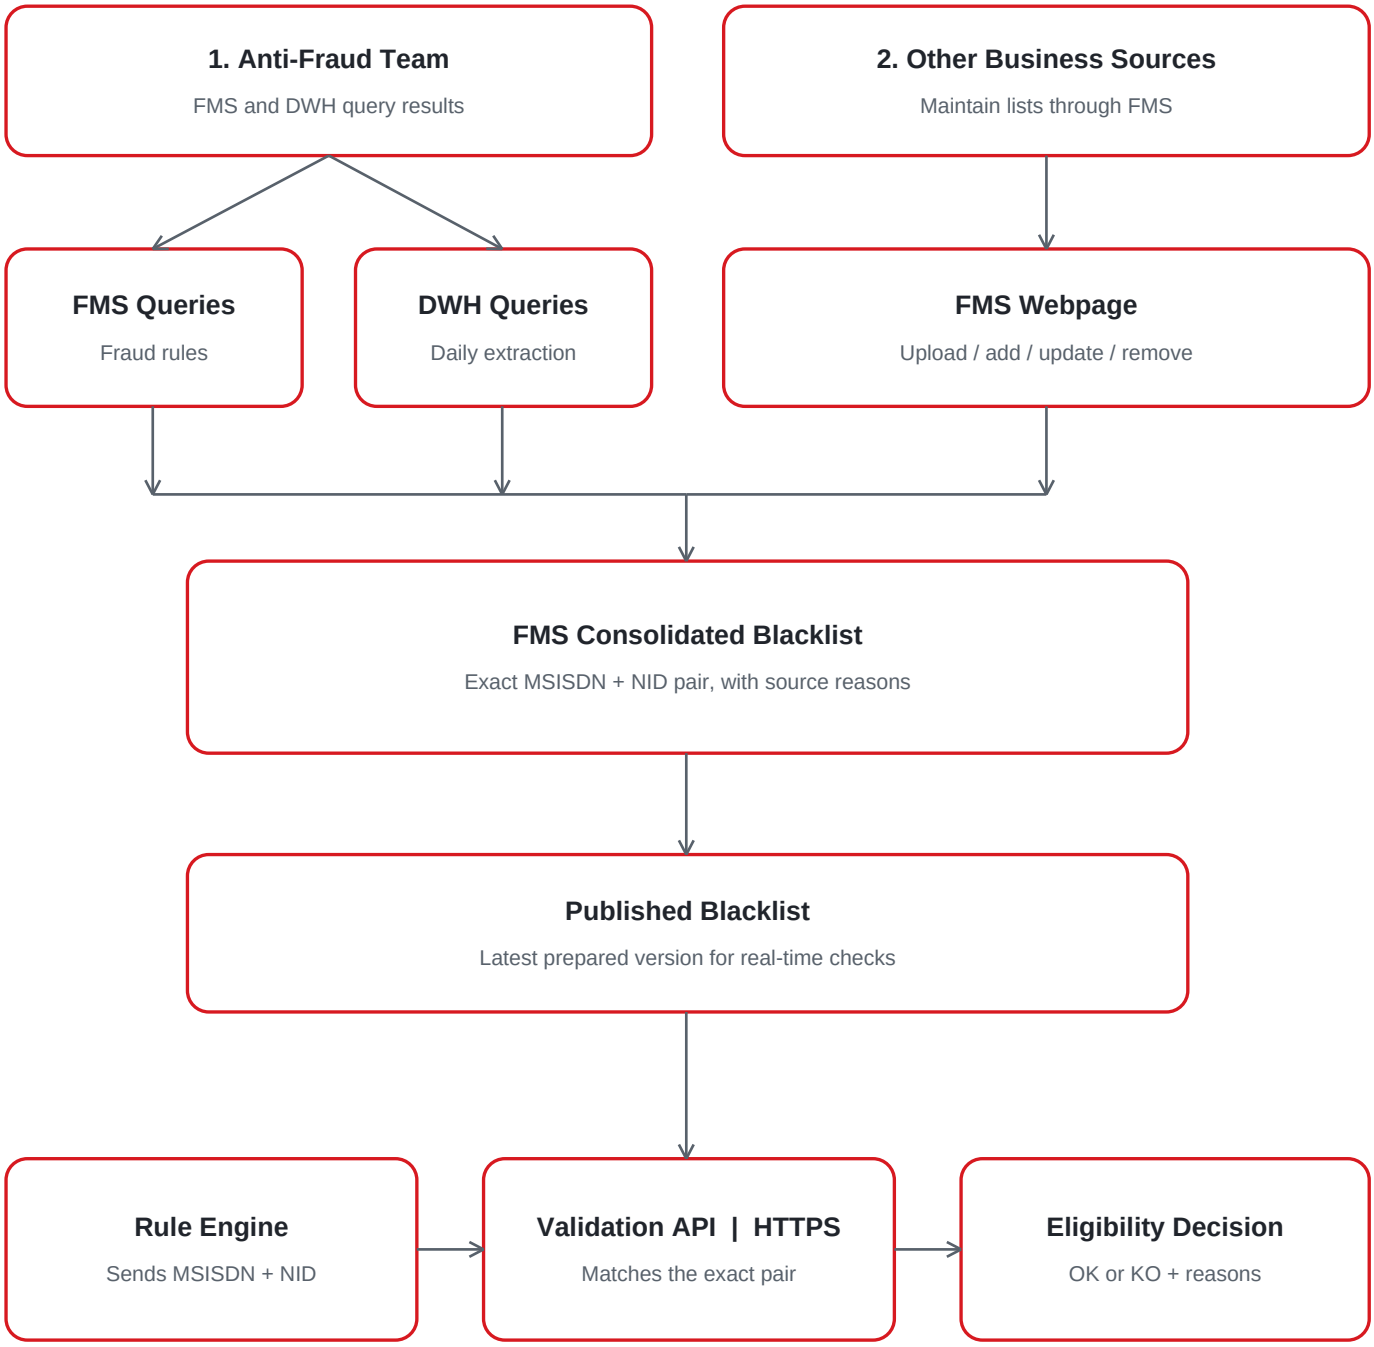
FMS / BLACKLIST VALIDATION

End-to-end business flow | Composite key: MSISDN + NID



Decision rule

OK - exact MSISDN + NID pair is not blacklisted.

KO - exact pair is blacklisted; applicable reasons are returned.

FMS / BLACKLIST VALIDATION

Business overview | How the system works

PURPOSE

FMS checks MSISDN and National ID (NID) together as one composite key.
The service returns an eligibility decision for the exact pair.

01 ANTI-FRAUD TEAM

Anti-Fraud defines blacklist criteria using queries executed in FMS and DWH.
The agreed DWH data is extracted daily and combined with FMS query results.

02 OTHER BUSINESS SOURCES

Authorized teams manage their entries through an FMS webpage.
They can upload files and frequently add, update or remove records.

03 BLACKLIST PREPARATION

FMS consolidates both source groups and retains applicable rejection reasons.
An updated blacklist is published for real-time validation.

04 REAL-TIME VALIDATION

The Rule Engine sends MSISDN + NID together over HTTPS.
The Validation API checks the exact combination in the published blacklist.

05 ELIGIBILITY RESPONSE

OK: no active blacklist entry exists for that exact pair.
KO: the pair is blacklisted; the relevant rejection reasons are returned.

OWNERSHIP

Anti-Fraud: query criteria | Other sources: webpage list maintenance
FMS: consolidate and operate | Rule Engine: request and use decisions
